
AI+ POWER 2026 · BUILDER'S DEMO

AGENTIC FINOPS FOR MULTI-CLOUD

A walkthrough of what I built — an agentic loop where AI spots cost issues, proposes a fix, and a human approves before anything touches infrastructure.

PRESENTED BY John NG — Partner Solution Architect

EVENT AI+ Power 2026

DATE 17 May 2026

— WHAT GOT ME THINKING

THE THING THAT KEPT BUGGING ME

I see it

A cost spike shows up in the dashboard — but the dashboard won't tell me what to do

I dig in

Half an hour later I've figured out the cause — and it was a forgotten dev instance again

I fix it

Two days after the spike. The waste already happened. I just cleaned up after it.

— OTHER BUILDERS TOLD ME THE SAME

IT'S NOT JUST ME, IS IT?

We're great at observing, bad at acting

We've invested in dashboards, alerts, and cost reports. But they all end with a human having to figure out the next step.

It's always the same class of problem

Forgotten dev instances. Oversized reservations. Idle resources. The diagnosis is repetitive — so why are we still doing it manually?

Agentic AI feels like the right fit here

Observe a signal, reason through options, take a bounded action. That's exactly what an agent is good at — so I tried building it.

THAT GOT ME THINKING...

"What if I connected an AI agent directly to my cost data and gave it the ability to act — with guardrails?"

THE SYSTEM I PUT TOGETHER

STEP 01

YOUR BILLS FLOW IN

Your cloud spending data from AWS and Alibaba syncs into OptScale automatically every day — no exports, no manual work.

DATA COLLECTION

STEP 02

A SPIKE IS SPOTTED

OptScale watches your spending 24/7. The moment something looks unusual — a sudden spike, an idle resource — it raises a flag instantly.

ANOMALY DETECTION

STEP 03

AI FIGURES OUT THE FIX

The AI chat agent reads the alert, understands the context, and proposes a remediation — with its reasoning shown so you can see exactly why it's suggesting that action.

AI REASONING

STEP 04

THE FIX HAPPENS

You review the agent's proposal and approve it. The action then executes on AWS. OptScale confirms the cost normalises. You stayed in control the whole time.

HUMAN-IN-THE-LOOP

The agent handles the detection and reasoning — you stay in the loop for every action that touches infrastructure.

Built with OptScale (open source) + AWS Quick Suite Chat Agent

WALK-THROUGH

LET ME SHOW YOU THE THING

01 THE SPIKE SHOWS UP

OBSERVE

OptScale catches it first — expenses charted, 21 cost recommendations already queued. Before I even open my laptop, it knows something's off.

02 THE AGENT WORKS IT OUT

REASON

Multi-Cloud FinOps Advisor

Welcome to Multi-Cloud FinOps Advisor! I help optimize cloud costs and resource utilization across your infrastructure.

Multi-Cloud FinOps Advisor

Ask a question...

All data

Smart

Analyze our current cloud spending and identify cost...

The Multi-Cloud FinOps Advisor — I ask it to analyse spend and surface underutilised resources. It pulls from OptScale and explains its reasoning before anything happens.

03 IT JUST... FIXES IT

ACT

Multi-Cloud FinOps - Potential Savings from Recommended Actions						
#	Resource / Service	Cloud Provider	Current Issue	Recommended Action	Before (Monthly Cost)	After (Monthly Cost)
1	EC2 i-0a3b7c (Production App Server)	AWS	CPU utilization avg 12%	Right-size from m5.xlarge to m5.large	\$160.64	\$140.16
2	Azure VM "analytics-node-03"	Azure	Running 24/7, used only business hours	Schedule auto-stop (nights/weekends)	\$438.00	\$156.43
3	RDS db-prod-replica-02	AWS	Read replica with 0 connections (30 days)	Decommission unused replica	\$720.00	\$0.00
4	GCP n2-standard-8 "ml-training-dev"	GCP	Idle 85% of time; not-training-dev	Convert to Spot/Preemptible VM	\$388.96	\$116.69
5	S3 Bucket "legacy-logs-2023"	AWS	4.2 TB in Standard; no access in 180 days	Move to S3 Glacier Deep Archive	\$96.77	\$4.03
6	Azure SQL Database "staging-db"	Azure	Provisioned 16 vCores; avg usage 3 vCores	Scale down to 4 vCores or Serverless	\$2,920.00	\$730.00
7	Elastic IP (x3 unattached)	AWS	3 EIPs not associated to any instance	Decommission / release	\$10.95	\$0.00
8	GCP Cloud Storage "temp-pipeline-data"	GCP	800 GB in Standard; accessed weekly	Move to Nearline Storage	\$16.80	\$8.40
9	AWS NAT Gateway (us-east-1)	AWS	Processing 5 TB/month; alternative available	Migrate to NAT Instance or VPC endpoints	\$225.00	\$67.50
10	Reserved Instance Coverage Gap	AWS	On-demand for 12 steady-state instances	Purchase 1-year RI (no upfront)	\$4,320.00	\$2,808.00

The agent surfaces a prioritised action table — rightsizing, auto-stop, decommission — with before/after costs. You review, you approve. Then it executes.

OPEN THE DEMO

WHAT I ACTUALLY LEARNED

Q The hardest part was the plumbing, not the AI

Getting clean, structured cost signals out of OptScale and into the agent took more work than writing the agent itself. The AI part was surprisingly straightforward once the data was right.

Q Human-in-the-loop isn't a limitation — it's the design

The agent suggests, you approve, AWS executes. Keeping that approval step isn't a workaround — it's what makes this safe to run on real infrastructure. The value is in the detection and reasoning, not in removing humans.

Q Open source made this experiment possible

OptScale is Apache 2.0 — I spun it up in 15 minutes with docker-compose, no procurement, no negotiation. That low barrier is what let me prototype fast and actually learn something real.

Q The "detect → explain → approve → fix" loop feels right

The first time I watched a real spike get caught, explained clearly, and resolved with one approval click — it felt like the right balance. Fast enough to matter, controlled enough to trust.

Want to build this yourself? Everything is open.

🔗 LIVE DEMO

SOLUTION ARCHITECTURE

AWS CLOUD

ALIBABA CLOUD

OPEN SOURCE

User → OptScale (FinOps Account) detects anomalies → Quick Suite Chat Agent reasons via AgentCore Gateway + MCP → actions loop back to OptScale. Billing data read-only from AWS CUR S3 and Alibaba Cloud RAM user.

OPEN FLOOR

QUESTIONS? LET'S DIG IN.

Happy to go deeper on any part of the build — the architecture, the tooling choices, what broke, or what I'd do differently next time.

THINGS WE CAN DIG INTO

- How OptScale ingests multi-cloud billing data
- How the Chat Agent connects to OptScale's API
- Guardrails and human-in-the-loop design decisions
- Adopting this pattern inside your organisation
